

Day 1 Documentation – Melos Lutolli

1. Objective

Today I learned the basics of C programming and how to work with a simple development workflow.

I created my first program in C, practiced writing code, and used an online compiler to run my programs.

2. Hello World Program

The Hello World program is the first and simplest program in C. It prints a message on the screen.

Code:

```
#include <stdio.h>

int main() {
    printf("Hello, World!\n");
    return 0;
}
```

Explanation:

- `#include <stdio.h>`
This allows the program to use input and output functions like `printf()`.
- `int main()`
This is the starting point of the program. Every C program begins here.
- `printf("Hello, World!\n");`
This prints text on the screen.
- `\n`
This moves the cursor to a new line after printing.
- `return 0;`
This ends the program and shows it ran successfully.

3. student_profile.c

This program prints my personal information such as name, age, and school.

Code:

```
#include <stdio.h>

int main() {
    printf("Name: Melos\n");
    printf("Age: 15\n");
    printf("School: BGT\n");
    return 0;
}
```

Explanation:

Each `printf()` displays a different piece of information on a new line.

4. Workflow

Steps I followed:

- Created the repository with the correct name
- Added collaborators (teachers and group members)
- Created my personal branch (Name-Surname)
- Created the Day1 folder
- Added all required files
- Uploaded my work to my branch

I used an online compiler to write and run my C programs.

5. What I Learned

- Basic structure of a C program
- How to use `printf()`
- Meaning of `\n` in output
- How to organize files correctly
- How to work in a personal branch
- How to use an online compiler to test code
